My steps for CocoaPods Installation:

Step 1. Open Terminal.
Step 2. Type in "$ sudo gem install cocoapods" as instructed below.
(https://guides.cocoapods.org/using/getting-started.html)

Getting Started

Installation

CocoaPods is built with Ruby and it will be installable with the default Ruby available on macOS. You can use a Ruby Version manager, however we recommend that you use the standard Ruby available on macOS unless you know what you're doing.

Using the default Ruby install will require you to use sudo when installing gems. (This is only an issue for the duration of the gem installation, though.)

```
$ sudo gem install cocoapods
```

If you encounter any problems during installation, please visit this guide.

Step 3. To create a Pod file in my project folder, I followed the YouTube tutorial from 1:00 to 2:45.
Create Graphs & Charts in App with Swift 5 (Xcode 11 | 2020) – iOS Academy
(https://www.youtube.com/watch?v=J9hl7HHXNHU&t=48s&ab_channel=iOSAcademy)

Step 4. To import Charts library, I followed the same YouTube tutorial from 7:30 to 8:00.
